

**IN THE CLAIMS**

Please amend the claims as follows:

1-23. (canceled)

24. (new) A method comprising the steps of:

computing first hash values derived from and representing a plurality of replicas of a resource, wherein the replicas are stored on respective data processing systems within a network;

a) storing the computed first hash values;

b) computing current hash values for the replicas of the resource;

c) comparing the current and first hash values in order to identify whether all the hash values match;

d) detecting whether a vulnerability exists responsive to the hash value comparison indicating at least one changed replica of the resource, wherein the detecting comprises:

detecting whether the at least one changed replica is greater in number than a predetermined number; and

wherein the method further comprises:

e) presenting a message for a user indicating a vulnerability, wherein the presenting is responsive to the predetermined number being exceeded.

25. (new) The method of claim 24, wherein steps a), b), c), and d) are performed at a first data processing system within the network.

26. (new) The method of claim 24, wherein step b) is performed at each replica's respective data processing system, the method further comprising sending the computed hash values to a first data processing system.

27. (new) The method of claim 24, wherein the vulnerability includes a vulnerability to a computer virus.

28. (new) The method of claim 24, wherein the vulnerability includes a vulnerability to computer hacking.

29. (new) The method of claim 24 further comprising:  
classifying as vulnerable the data processing systems storing the replicas, wherein the classifying is responsive to the predetermined number of changed replicas of the resource being exceeded.

30. (new) The method of claim 24, the steps further comprising:  
sending a notification of the vulnerability to each data processing system storing one of the replicas;  
selecting a sequence of vulnerability-resolution instructions relevant to the vulnerability;  
and  
sending the selected instructions to each of the data processing systems storing one of the replicas.

31. (new) An apparatus comprising:

a processor; and

a storage device connected to the processor, wherein the storage device has stored thereon a program, wherein the processor is operative to execute instructions of the program to implement a method comprising the steps of:

computing first hash values derived from and representing a plurality of replicas of a resource, wherein the replicas are stored on respective data processing systems within a network;

a) storing the computed first hash values;

b) computing current hash values for the replicas of the resource;

c) comparing the current and first hash values in order to identify whether all the hash values match;

d) detecting whether a vulnerability exists responsive to the hash value comparison indicating at least one changed replica of the resource, wherein the detecting comprises:

detecting whether the at least one changed replica is greater in number than a predetermined number; and

wherein the method further comprises:

e) presenting a message for a user indicating a vulnerability, wherein the presenting is responsive to the predetermined number being exceeded.

32. (new) The apparatus of claim 31, wherein steps a), b), c), and d) are performed at a first data processing system within the network.

33. (new) The apparatus of claim 31, wherein step b) is performed at each replica's at respective data processing system, the method further comprising sending the computed hash values to a first data processing system.

34. (new) The apparatus of claim 31, wherein the vulnerability includes a vulnerability to a computer virus.

35. (new) The apparatus of claim 31, wherein the vulnerability includes a vulnerability to computer hacking.

36. (new) The apparatus of claim 31, the steps further comprising:  
classifying as vulnerable the data processing systems storing the replicas, wherein the classifying is responsive to the predetermined number of changed replicas of the resource being exceeded.

37. (new) The apparatus of claim 31, the steps further comprising:  
sending a notification of the vulnerability to each data processing system storing one of the replicas;  
selecting a sequence of vulnerability-resolution instructions relevant to the vulnerability;  
and  
sending the selected instructions to each of the data processing systems storing one of the replicas.

38. (new) A computer program product, stored on a tangible, computer readable medium, said computer program product having instructions for execution by a computer system, wherein the instructions, when executed by the computer system, cause the computer system to implement a method comprising the steps of:

computing first hash values derived from and representing a plurality of replicas of a resource, wherein the replicas are stored on respective data processing systems within a network;

a) storing the computed first hash values;  
b) computing current hash values for the replicas of the resource;  
c) comparing the current and first hash values in order to identify whether all the hash values match;

d) detecting whether a vulnerability exists responsive to the hash value comparison indicating at least one changed replica of the resource, wherein the detecting comprises:

detecting whether the at least one changed replica is greater in number than a predetermined number; and

wherein the method further comprises:

e) presenting a message for a user indicating a vulnerability, wherein the presenting is responsive to the predetermined number being exceeded.

39. (new) The computer program product of claim 38, wherein steps a), b), c), and d) are performed at a first data processing system within the network.

40. (new) The computer program product of claim 38, wherein step b) is performed at each replica's respective data processing system, the method further comprising sending the computed hash values to a first data processing system.

41. (new) The computer program product of claim 38, wherein the vulnerability includes a vulnerability to a computer virus.

42. (new) The computer program product of claim 38, wherein the vulnerability includes a vulnerability to computer hacking.

43. (new) The computer program product of claim 38, the steps further comprising:  
classifying as vulnerable the data processing systems storing the replicas, wherein the  
classifying is responsive to the predetermined number of changed replicas of the resource being  
exceeded.

44. (new) The computer program product of claim 38, the steps further comprising:  
sending a notification of the vulnerability to each data processing system storing one of  
the replicas;  
selecting a sequence of vulnerability-resolution instructions relevant to the vulnerability;  
and  
sending the selected instructions to each of the data processing systems storing one of the  
replicas.
